

HACKYEAH 2026 · SUPERTeam POLAND

# Bestcrow

Escrow that releases by **rule**, not by an operator. Startup/prototype crowdfunding on Solana where backers approve each release and every failure path is permissionless.

Anchor program

· Backer-weighted votes

· Pro-rata refunds

**PROBLEM · WHO IT HURTS**

## Two people who don't know each other, and a platform both must trust

**The creator**

Needs capital before the work exists.  
Today that means a platform decides if the campaign qualifies, and holds every pledge until it pays out.

**The backer**

Hands money to a stranger and to the platform. If the target is met, the creator usually gets the whole balance — with no further accountability.

Named users: **early-stage startup / prototype teams** raising in milestones, and their backers. Reward/grant funding — not equity.

### THE INTERMEDIARY, NAMED

## The operator is **custody plus discretionary payout**

### Before (Kickstarter-style)

Custodies all pledges · charges a cut · can freeze or reject · on success pays the creator everything at once.

### After (Bestcrow)

Funds sit in a program-owned vault · schedule + recipients fixed at creation · releases gated by backer votes · failure refunds pro-rata.

**Why not a database?** A DB admin can edit state and still controls the payout rails. Here the rule — not an operator — is the source of truth.

## HOW IT WORKS · PART 1

# Terms are **locked before** the first pledge

Create draft

Add 2–5 tranches (≤50% each, =100%)

Seal & open funding

- Funding window **7–183 days**; overfunding allowed — no cap at the goal.
- Each tranche's share, work period and recipients are fixed; no post-start edits.
- A creator **bond** is posted separately from backer funds.

## HOW IT WORKS · PART 2

# Backers approve each release — the rule decides

### Evidence → 7-day vote

Weight = final pledge. Approval needs **>50%** of all contributions. Exactly 50% or no votes = no.

### One revision, then stop

First failure opens **30 days** to improve, then a second 7-day vote. Second failure → termination.

An approved tranche is payable **exactly once** to a fixed recipient. Anyone may trigger the technical release once the rule is satisfied.

#### HOW IT WORKS · FAILURE IS FIRST-CLASS

## Every failure path is **permissionless** and **pro-rata**

- **Missed goal:** no fee; each backer claims 100% of their own pledge.
- **Termination:** the remaining pool is frozen and refunded proportionally to frozen pledge weight.
- **Double-claim guard:** refunds/releases are exactly-once; a closed ledger can't be replayed.
- **Anyone can submit** an eligible finalize/refund transaction — a timer never moves money by itself.

PROOF, NOT A MOCKUP

## Live on Solana **devnet** — confirmed transactions

**Deployed** charity-vault · 74GsU9x...ZBVr-style program with 18 instructions

- Program id **74GsU9xRv9qvVHXXvTAAmRp8ETTEAwGjV1UkJQ6BZNpG** — owner: BPF upgradeable loader.
- End-to-end flow exercised on devnet: create → pledge → finalize → claim/refund, with explorer links.
- Runnable demo: `docker compose up --build` → web app + indexer/API.

**BUILT FOR THE ECOSYSTEM**

## On Solana's current stack — reusable, auditable, testable

**On-chain**

Rust + **Anchor 1.1.2**. Fixed-size account state, checked math everywhere, program-owned vault PDAs.

**Client & tests**

@solana/kits + Wallet Standard (Phantom), Next.js 16. **LiteSVM** end-to-end tests; 22 client tests, 7 program tests green.

A Node/SQLite indexer + REST API serves fast listings; the program remains the only authority over funds. Tokenless — no oracle, no market to manipulate.

## WHAT IS TRUE TODAY

# Verified, implemented, and the one honest limit

### Status tags

- verified** devnet deploy + confirmed tx
- implemented** program, client, indexer
- in progress** target-MVP economics
- planned** mainnet hardening

### The honest limit

The program enforces **money**, not worthiness or delivery. It can't verify a product or prove handover. Upgrade authority is disclosed. Real use needs a legal/KYC layer — we show the financial mechanics.

**WHY THIS WINS · WHAT'S NEXT**

## Rule-enforced custody — and a roadmap that keeps the trust honest

**Mapped to the rubric**

**Relevance 30%** operator custody removed on-chain · **Completeness 25%** live devnet flow · **Idea 20%** named user + honest boundary · **Impl. 15%** Anchor + tests + client · **Originality 10%** tokenless conditional vault.

**Next one week**

Finish the staged vote/release on the new program, run the adversarial test matrix, redeploy, and add a durable public terms/evidence store. Then grants + a design partner.

**Ask:** try the live demo, read the repo, and point us at a real charity/prototype team to pilot.
